

# APPENDIX 8 : MAIN BUSBAR SIZING

## 8.1 MAIN BUSBAR

### BUSBAR SIZING

The factors that must be taken into account in determining the size of busbars include:

#### a. Diversity factor :

Not all the loads supplied by a set of busbars are used at full rated load or at the same time. The diversity factor is the means to determine the maximum load current used to size the busbars. Standard IEC 61439-1 and 2 specifies the table below.

Number of Cicuits	Diversity Factor
2 - 3	0,9 (%90)
4 - 5	0,8(%80)
6 - 9	0,7(%70)
10 and more	0,6(%60)

For example:

Total equipment circuit : 2700A

Equipment quantity : 22 ---> Diversity factor : 0,6

Requiring main busbar circuit :  $2700 \times 0,6 = 1620A$

#### b. Degree of IP Protection:

IP protection which means to protection against solid and liquid objects in the environment is a necessity for a switchboard to survive the functions for a long time period and to protect against short circuits and harmful chemicals can be cause corrosion. For that reason PDS switchboards are designed according to IP 53. This protection limits the air circulation inside the switchboard and effects heating operational temperature of busbars. In case of removing the metal filter and metal case the IP protection decreases to IP2X. Then the operational temperature of busbar can be decrease.

Additionally there is an another way to decrease operational temperature that using forced air with fan motors.

For see the technics please go on Thermal Management Instructions.

In the sheets of current - rated current (In) - according to busbar sizes are values where tested in 25°C ambience temperature without any air circulation limits so called nominal. In the following pages there will be selection tables for currents in different IP protection selections.

#### c. Ambient Temperature around the switchboard:

The maximum load current for a set of busbars is a function of the thermal environment.

The type and the size of the conductors must be determined in view of carrying the required currents taking into account the temperatures reached in the switchboard. These conductors are subjected to additional heat rise caused by the flowing current (joule effect) and the connected devices.

The temperatures reached by the conductors and the insulating materials, etc. must not exceed the maximum temperatures for which the products were designed. PDS busbars are sized to operate without any particular constraints for the assemblies in switchboards operating under normal environmental conditions.

IEC 61439-1 permits higher overtemperature limits than 105 K, the absolute busbar temperature at an ambient temperature of 35°C and 105K over temperature limitis 140°C. Temperature 140°C is significantly below the thermal softening of copper material.

In the selection tables in below calculation of over temperature limits 105°C as a limit of PDS according to permissible temperature limits on insulated materials which is inside the IEC 61439-1 limit.

## APPENDIX 8 : MAIN BUSBAR SIZING

		Permissible current (A) at maximum 105°C Bare Busbar Temperature up to 60 Hz (E-Cu F30)								
Type of Busbar	Nominal(In) 25°C +30K	Air Ventilation	IP Protection	Average Ambient Temperature around the Switchboard						
				20°C	25°C	30°C	35°C	40°C	45°C	50°C
